Adaptive Filtering Theory And Applications

An adaptive filter is a system with a linear filter that has a transfer function controlled by variable parameters and a means to adjust those parameters according to an optimization algorithm. Because of the complexity of the optimization algorithms, almost all adaptive filters are digital filters. Adaptive filters are required for some applications because some parameters of the desired processing operation are not known in advance or are changing. The closed loop adaptive filter uses feedback

Adaptive Filtering - Theory and Applications

Over the past few years a number of new adaptive filter algorithms have been developed and applied to meet demands for faster convergence and better tracking properties than earlier techniques could offer. Applications include adaptive channel equalization, adaptive predictive speech coding and on-line system identification.

The advancement of adaptive digital systems, in particular adaptive filters with applications to acoustic echo and noise control, but also to digital transmission systems, has been influenced by the work of Eberhard Hänsler and his research group members who contributed to this area over

several decades.

One common adaptive filter application is to use adaptive filters to identify an unknown system, such as the response of an unknown communications channel or the frequency response of an auditorium, to pick fairly divergent applications. Other applications include echo cancellation and channel identification.

Applications of Adaptive Filtering 5 In practical applications the measurement noise is unavoidable, and if it is uncorrelated with the input signal, the expected value of the adaptive-filter coefficients will coincide with the unknown-system impulse response samples. The output error will of course be the measurement noise (Diniz, 2008).

An adaptive filter has an adaptation algorithm that is meant to monitor the environment and vary the filter transfer function accordingly. Hence, based in the actual signals received, the adaptive filter attempts to find the optimal filter design. The basic operation now involves two processes:

REPORT On Adaptive Filters- Implementation and Applications

Adaptive filtering can be used to characterize unknown systems in time-variant environments. The main objective of this approach is to meet a difficult compromise: maximum convergence speed with maximum accuracy.
