Mechanical Engineering Machine Drawing Eccentric

In mechanical engineering, an eccentric is a circular disk solidly fixed to a rotating axle with its centre offset from that of the axle. It is used most often in steam engines, and used to convert rotary into linear reciprocating motion to drive a sliding valve or pump ram. To do so, an eccentric usually has a groove at its circumference closely fitted a circular collar. An attached eccentric rod is suspended in such a way that its other end can impart the required reciprocating motion. A retur
